

Tuesday 20th March 2018

To the Health Select Committee

RE: Submission from the Multiple Sclerosis Society of New Zealand (MSNZ) on the Misuse of Drugs (Medicinal Cannabis) Amendment Bill

With the increasing interest in Medicinal Cannabis for managing pain and spasticity in MS and other chronic conditions Multiple Sclerosis NZ and Motor Neurone New Zealand jointly commissioned, in 2017, a written report entitled *Review of Current Research Regarding the use of Medicinal Cannabis for MS and MND Symptom Management (December 2017)* – to:

1. Review and report on current research on the use of medicinal cannabis for multiple sclerosis (MS) and motor neurone disease (MND) symptom management;
2. Examine the risks and the risk/benefits of using medicinal cannabis; and
3. Review the current international recommendations for the safe use of medicinal cannabis for MS and MND symptom management.

The report is designed to contribute to an informed debate about the information and research into the benefits that cannabis can provide medicinally. The information is intended to allow the reader to formulate their own informed decision as to their support or otherwise for use.

Using this information, MSNZ is making a submission to the Health Select Committee on the Misuse of Drugs (Medicinal Cannabis) Amendment Bill. We would like to note that our position focusses on the impact to people with MS only as we do not have the mandate to speak on behalf of other organisations or conditions.

About MSNZ

MSNZ is a non-profit organisation formed in 1967 to advocate for systemic change so the 4000 people diagnosed with MS in New Zealand have access to first world treatment, resources and services to improve their well-being and quality of life. The work of MSNZ aims to reduce the burden of MS on those diagnosed, their carers and families.

MSNZ is the national body of MS organisations in New Zealand providing support, information, educational resources and training opportunities to our member organisations, 18 independent regional societies who provide support to people living with MS in their communities.

Defining Medicinal Cannabis

In our understanding of the term 'Medicinal Cannabis' MSNZ refers to cannabis or cannabis based products that:

- 1) are used for approved medicinal purposes; and
- 2) have been produced under carefully controlled conditions where the active ingredients, THC and CBD, are able to be regulated so that the hallucinogenic properties have been removed.

Our research has not looked into the different types of Medicinal Cannabis products and their benefits over each other but focusses on reviewing the proven benefits and risks associated with cannabis use for medicinal purposes in MS.

We see it as important that the Health Select Committee clearly define the terminology of Medicinal Cannabis going forward in this process. We are also clear that Medicinal Cannabis should only be available on prescription from a registered medical practitioner where evidence supports the use.

Evidence to support the use of Medicinal Cannabis for benefitting MS pain and spasticity

Pain and spasticity are well known effects of MS and can have a detrimental effect on a person's mental health, wellbeing and quality of life. Many find little or no relief in the currently available medications, which also possess their own side effects and dependencies. This has resulted in the need to explore alternative options. Several years of global studies and research into the positive effects of the use of cannabis has proven that positive benefits can be provided to people with MS in the symptomatic management of pain and spasticity.

Pain can be neuropathic (arising from damage to the nervous system), related to muscle spasms, nerve damage or a combination. Studies have shown cannabis can reduce neuropathic (nerve damage) pain by 30% and is more effective than gabapentin, the current frontline therapy for neuropathic pain. In a 2016 study of chronic pain (both neuropathic and non-neuropathic), 69.5% of patients reported a significant reduction in pain scores and improvement in quality of life. Additionally, 44% of participants who were taking opioids at the start of the study had completely discontinued use by the end.

The majority of medicinal cannabis studies have researched spasticity in muscles where they involuntarily contract. This causes tightness, stiffness and pain in muscles and can interfere with normal movement. However, it should be noted that spasticity also affects other internal organs including the bladder which have not been studied. It has been known since 2000 that cannabinoids can control spasticity in MS. Studies have shown that patients have reported a 29.4% improvement in muscle stiffness through cannabis use. In New Zealand the only pharmaceutical grade cannabis product, Sativex, has been approved by MedSafe for use in MS spasticity but not pain. PHARMAC have declined to fund Sativex for use in MS spasticity and currently must be paid for privately.

The results of many of the studies focus on the patient reported outcomes. This should not diminish the importance of the results. Pain and spasticity are significant contributors to people with MS having poor mental health, depression, inability to work, contribute to their communities or look after their families. Many people with chronic pain and spasticity, who would benefit most from access to medicinal cannabis, do not have access to other treatments in New Zealand. Symptom management is the only option available.

It is also important to highlight that MS is a chronic but not terminal condition which people can live with for 30+ years. Safe, free and legal access will support these people who live with chronic pain and spasticity for many years, rather than at the end of their life. Through education, informed

consent and control of the products available, people with MS should be able to make their own fully-informed decisions about whether the benefits outweigh the potential risks.

MSNZs position on the Misuse of Drugs (Medicinal Cannabis) Amendment Bill

MSNZ supports regulated cannabis-based products for medicinal purposes being made available, free and legally, to people with MS for the management of pain and spasticity, on prescription from their GP or neurologist.

The Society always recommends people with MS educate themselves about the benefits and potential risks of any treatment option and make decisions in consultation with their families and primary health care providers.

Thank you

We hope this submission and our attached research review report will be beneficial in the Health Select Committees decision making process regarding the Misuse of Drugs (Medicinal Cannabis) Amendment Bill. We thank you for allowing us the opportunity to engage with this process and present the case for the MS community in New Zealand based on the evidence available.;

Should you require any more information from the Multiple Sclerosis Society of New Zealand we welcome your questions and requests.

Kind Regards,

Amanda Rose
MSNZ National Manager
